

# Virginia Quiet Pavement Demonstration Program

Kevin K. McGhee, P.E.

2015 RPUG Meeting - Raleigh

# Virginia “Quiet Pavements” Program (Code of Virginia § 33.1-223.2:21)

- **Directs VDOT to:**
  - *Expedite the development of quiet pavement (QP) technologies such that applicable contract solicitations include specs for QP technology if sound mitigation is a consideration.*
- **To that end, VDOT will:**
  - *Construct demonstration projects to assess QP technologies.*
  - *Monitor and report results of use of QP technologies in other states.*
  - *Evaluate functionality/ safety in Virginia's climate over four full winters.*

# “Quieter” Pavement

## What it is:

- In General – a wearing surface that minimizes tire-pavement noise production and propagation
- Asphalt – “small-textured” porous mix (e.g., open-graded asphalt concrete)
- Concrete – negative-textured longitudinal grind and groove (e.g., “Next Generation Concrete Surface”)

## What it isn't:

- A universal substitute for noise barriers

# Asphalt Projects

Plan View

# Concrete Projects

Plan View

# Project Selection Criteria

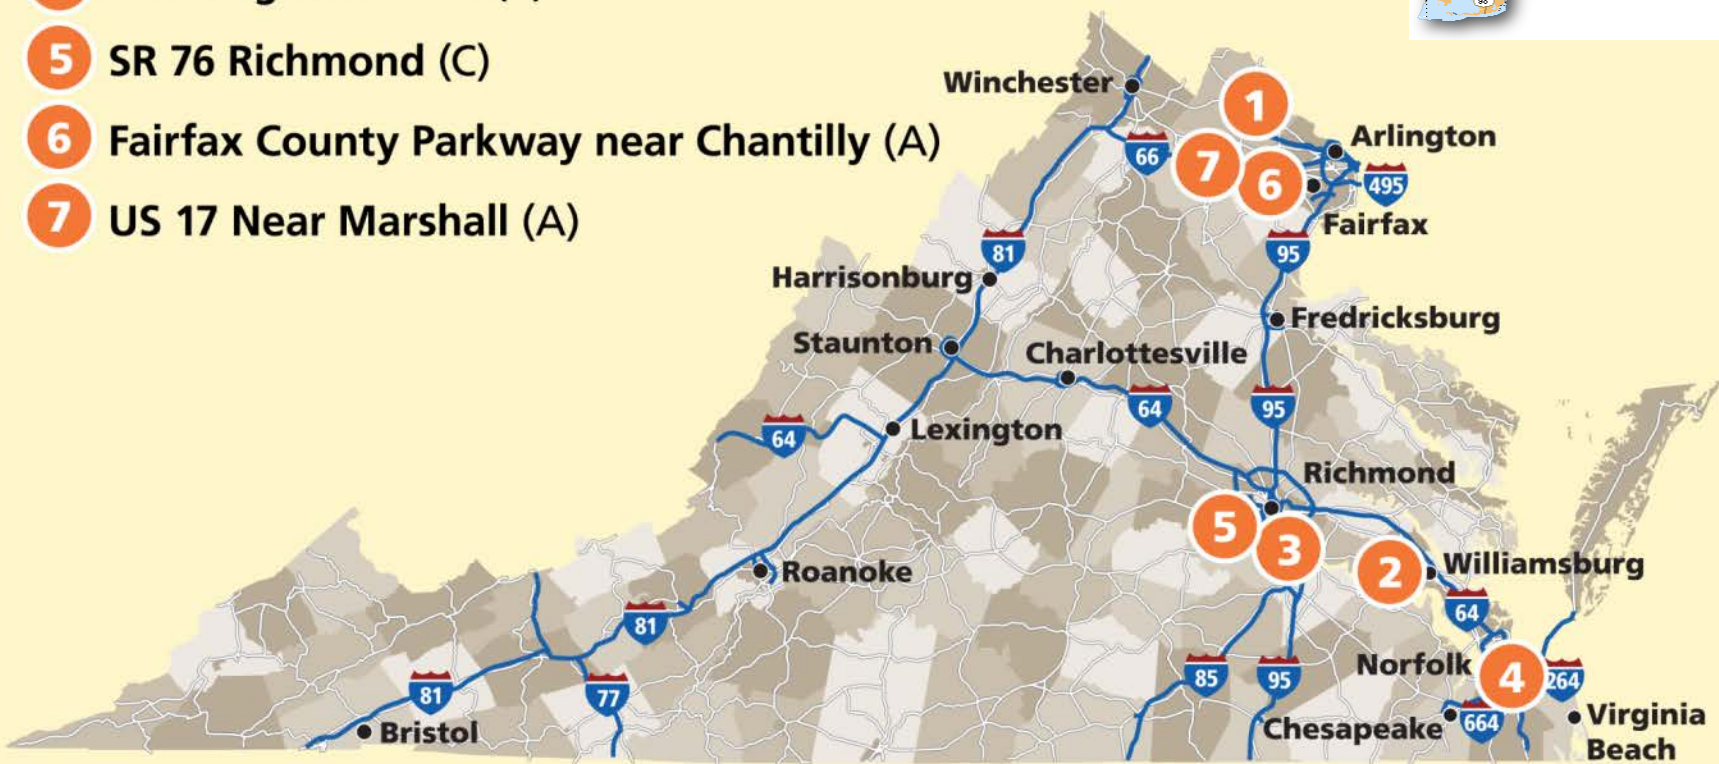

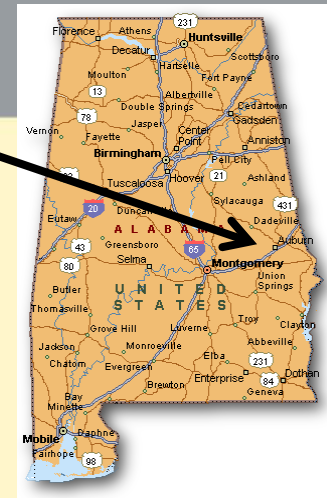

- Characteristics that support tire-pavement noise as predominant traffic noise contributor
  - Higher speeds
  - Free flowing
  - Lower to limited access

# Demonstration Projects 2011/12

- 1 SR 7 By-Pass in Leesburg (A)
- 2 SR199 west of Williamsburg (A)
- 3 SR 288 near Chester (A)
- 4 I-64 Virginia Beach (C)
- 5 SR 76 Richmond (C)
- 6 Fairfax County Parkway near Chantilly (A)
- 7 US 17 Near Marshall (A)

# User Cost Savings – Case Study

2011 Demo Site 3	
“Control” IRI	74 in/mi
QP IRI	62 in/mi

QP Costs (per 2-lane mile)	
Most Expensive (QP1)	\$ 180,224
Least Expensive (QP2)	\$ 73,498

Cumulative Savings* (reduced fuel consumed)	
Year 1	\$ 28,463
Year 2	\$ 57,780
Year 3	\$ 89,990
Year 4	\$123,166
Year 5	\$157,338
Year 6	\$192,536
Year 7	\$228,789
Year 8	\$266,131
Year 9	\$304,593
Year 10	\$344,210

\* Not Agency Savings

“Cold Start”?

A close-up photograph of asphalt pavement. On the left side, there is a thick, bright yellow painted line. To the right of this line, the asphalt surface shows significant distress. A diagonal crack runs from the top center towards the bottom right. Along this crack, the dark asphalt surface has been eroded, revealing a lighter, greyish-white material underneath. The texture of the asphalt is rough and granular. The text 'Distress triggered by line eradication' is overlaid in yellow in the upper right quadrant.

Distress  
triggered by  
line eradication

# Summary of Findings

- QP technologies provide beneficial spray reduction and improved skid resistance – wet weather.
- For asphalt QPs (PFC) - Noise reduction levels are not noticeable compared to control surfaces after 4 winters (< 2dB)
- For concrete QP (NGCS) – Noise reduction levels are noticeable compared to control after 4 winters (~5dB)
- None of the technologies provided sufficient noise reductions to singularly meet federal regulations – Minimum of 7dB for single receptor and, minimum of 5dB for at least 50% of receptors.

## Consider PFC's for some traffic noise mitigation and improved wet-weather function when:

- Traditional noise barriers are not practical and/or desirable
- Tire-pavement interaction is the primary traffic noise source
- Alignment/cross-section meets Interstate-caliber geometric requirements
- Heavy winter maintenance activities are rarely necessary
  - deicing salts/brines a normal first approach
  - accumulating frozen precipitation is uncommon
- The existing pavement is structurally sufficient or will be made so

## Site Selection:

- “Spot” applications are strongly discouraged. Establish natural project limits with uniformity for maintenance and use (under any weather conditions)
- Avoid facilities with poor geometrics

## Construction considerations:

- Use very heavy tack-coat
- Make sure lay-down equipment is well heated – “waste” first load after passing through the material transfer vehicles (MTVs).
- Always “daylight”. Beware adjacent dense-graded shoulders, turn-lanes, or wide cross-overs.

## Winter Maintenance!:

- PFC surfaces require careful and constant monitoring during any winter event
- Higher levels of salt and liquid anti-icing materials will be necessary (magnesium chloride solutions have proven effective)
- Use of abrasives will reduce porosity and substantially reduce functional service life
